According to our (Global Info Research) latest study, the global Lovir-Class Active Pharmaceutical Ingredient (API) market size was valued at US\$ 221 million in 2025 and is forecast to a readjusted size of US\$ 299 million by 2032 with a CAGR of 4.4% during review period.

Lovir-class active pharmaceutical ingredients are chemically synthesized antiviral APIs represented by acyclovir, valacyclovir hydrochloride, ganciclovir, ganciclovir sodium, valganciclovir hydrochloride, famciclovir and penciclovir, and are primarily used in formulations for herpes simplex virus, varicella-zoster virus and cytomegalovirus-related infections. The main commercial forms include free-base APIs, hydrochloride salts and sodium salts. Key upstream materials generally include guanine, 6-chloroguanine, diacetyl guanine, diacetyl acyclovir, valine-derived intermediates, salt-forming reagents, pharmaceutical-grade solvents and other specialty antiviral intermediates, while downstream customers mainly consist of generic finished-dose manufacturers, vertically integrated pharmaceutical companies, export-oriented drug producers and global buyers with regulated-market filing capabilities. On an ex-factory basis, the global lovir-class API industry is conservatively estimated to have reached a nominal production capacity of approximately 3,980 metric tons in 2025, with actual sales volume of about 2,286.7 metric tons, an average selling price of roughly USD 93.85 per kilogram and an overall gross margin range of approximately 24%-33%.

The lovir-class API market has entered a relatively mature stage, with its demand base still anchored by established anti-herpesvirus molecules such as acyclovir and valacyclovir hydrochloride. Market competition is no longer driven primarily by simple capacity expansion, but increasingly by cost control, supply reliability, regulatory

compliance, documentation depth and long-term customer retention. China and India remain major global manufacturing centers, while European suppliers tend to maintain stronger positioning in regulated markets and higher-value specialty supply. As competition in downstream generics intensifies, pricing pressure on mature molecules continues to rise, and suppliers with scalable manufacturing, stable quality systems and proven international filing capabilities are gradually gaining a stronger competitive edge.

From a product portfolio perspective, the market is moving from a predominantly high-volume structure toward a more differentiated mix with greater emphasis on value-dense molecules. Acyclovir and valacyclovir still account for the core of physical demand, but ganciclovir and valganciclovir hydrochloride, which are associated with cytomegalovirus-related treatment needs, are becoming increasingly important in manufacturers' portfolio upgrades. Recent corporate disclosures in China show continued work on process development, registration progress and commercial preparation for these higher-barrier APIs, indicating a gradual shift from broad antiviral raw-material supply toward more specialized and differentiated competition. This trend supports better value capture, but it also raises the threshold for R&D translation, regulatory execution and high-standard pharmaceutical manufacturing.

The main growth drivers of the industry remain structurally clear. Persistent treatment demand for herpesvirus infections and herpes zoster continues to sustain baseline consumption, while the clinical relevance of cytomegalovirus-related therapies in transplant and immunocompromised patient populations supports the strategic importance of higher-complexity molecules. At the same time, policy support for API industrial bases, pharmaceutical supply-chain resilience, registration reform and international market access is encouraging manufacturers to strengthen compliance systems and expand regulated-market capabilities. Companies that can combine API and formulation development, promote domestic and overseas filings in parallel and build deeper vertical integration across key intermediates and final APIs are better positioned to benefit from future industry evolution.

Several constraints will continue to shape the market outlook. Mature products such as acyclovir and valacyclovir have relatively transparent process routes, which means pricing competition among existing suppliers and potential entrants is likely to persist. Higher-value molecules offer attractive opportunities, but their market size, technical requirements and regulatory barriers prevent rapid and broad-based participation by all manufacturers. In addition, rising standards for overseas filings, customer audits and supply-chain security require sustained investment, particularly for companies targeting regulated export markets. Over time, the market is likely to evolve into a two-track

competitive structure: efficiency-driven competition in mature bulk molecules, and capability-driven competition in more specialized, higher-barrier APIs. Suppliers with durable strengths in process optimization, regulatory filings and global delivery will be the ones most likely to preserve margins and expand their strategic relevance.
