## Abstracts

According to our (Global Info Research) latest study, the global Low Carbon Coating market size was valued at US\$ 6791 million in 2025 and is forecast to a readjusted size of US\$ 8871 million by 2032 with a CAGR of 3.9% during review period.

In 2025, the global production of low-carbon coating is estimated at 6 million tons, with an average selling price of approximately US\$1,100 per ton, a gross profit margin of about 35%, and a single production line capacity of approximately 80,000 tons per year. Low-carbon coating solves the problems of high pollution, high maintenance, and high carbon emissions throughout the entire supply chain associated with traditional coatings, making them a key green material for achieving net-zero emissions in the construction, industry, and transportation sectors. Low-carbon coatings refer to coating products and technologies that can significantly reduce greenhouse gas emissions throughout their entire lifecycle through systematic technological innovation and management optimization. The upstream sector consists of suppliers of specialty bio-based/renewable raw materials (such as vegetable oils and waste oil derivatives), low-environmental-impact resins and pigments, and green solvents. The technological barriers lie in stable supply and performance balance. The downstream sector is highly diversified across architectural coatings, transportation (automotive/shipping), and industrial protection (wind power) fields.

The market growth of low-carbon coating is primarily driven by three core factors: 1. Mandatory global climate regulations: EU CBAM carbon tariffs and China's dual-carbon policy directly translate product carbon footprint into cost, driving green substitution across the entire industry chain. 2. Technological advancements and cost inflection points: The increasing maturity of technologies such as bio-based monomers and high-

performance waterborne resins has gradually made low-carbon coatings commercially competitive in terms of performance and cost. 3. Circular economy and waste management: Stricter regulations on coating waste and microplastic pollution are promoting the research and development of biodegradable and easily recyclable coating materials.
