Abstracts

Low Dead Volume (LDV) Syringes and Needles Are Designed to Limit the Dead Zone That Exists Between the Syringe Interface and the Needle. Vaccines Are Encapsulated in Small Glass Vials That Require a Syringe for Extraction at the Time of Injection. Pharmaceutical Companies Typically Fill the Vials with More Vaccine Than is Needed for the Dosage to Ensure That Sufficient Doses Are Available Even with Losses Such As Spillage, Often Leaving Excess Vaccine Liquid in the Vials. the Use of Special Low Dead Volume (LDV) Syringes and Needles, on the Other Hand, Allows the Remaining Liquid to Be Aspirated. The So-called 'dead Volume' Comes from the Space Between the Plunger and Needle of the Syringe, Where a Small Amount of Vaccine Fluid is Left, and the Low Dead Volume Syringe Reduces the Amount of Vaccine Left Behind.
