## Abstracts

According to our (Global Info Research) latest study, the global Low Free (LF) Isocyanate market size was valued at US\$ 531 million in 2025 and is forecast to a readjusted size of US\$ 730 million by 2032 with a CAGR of 4.7% during review period.

Low Free (LF) isocyanate refers to a type of isocyanate product in which the content of free isocyanate monomers is at a relatively low level. Isocyanates generally refer to compounds containing the isocyanate functional group ( $-N = C = O$ ). Under normal circumstances, isocyanate products may contain a certain amount of unreacted isocyanate monomers. However, low - free isocyanates are produced through special manufacturing processes or post - treatment procedures, which significantly reduce the content of free isocyanate monomers in the products. For example, in the preparation of some high - performance polyurethane materials, the isocyanate raw materials are purified and modified to control the content of free isocyanate monomers within a very low range.
