Abstracts

The global Low Free Polyurethane Prepolymers market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The term 'low free' in low free polyurethane prepolymers refers to the low content of unreacted isocyanates in the material. Free isocyanates are the isocyanate monomers that have not fully reacted with the polyols to form polymers. Controlling the level of free isocyanates in polyurethane production helps regulate the performance and reaction rate of the polyurethane.

Low free polyurethane prepolymers exhibit the following characteristics:

High reactivity: Due to the lower content of free isocyanates, the prepolymers have higher reactivity and can react more quickly with polyols.

Long-term storage stability: Low free polyurethane prepolymers are relatively stable during storage and less prone to undergo polymerization reactions.

Adjustability: The hardness, elasticity, and other properties of polyurethane can be adjusted by varying the ratio of isocyanates to polyols in the prepolymers.

Low free polyurethane prepolymers play a crucial role in polyurethane production. They are essential components for manufacturing polyurethane elastomers, coatings, adhesives, sealants, and other polyurethane-based products. Prepolymers react with chain extenders or crosslinkers under specific process conditions to form the final polyurethane products.

Low free polyurethane prepolymers refer to a type of polymer compound that serves as a precursor to polyurethane. Prepolymers are formed by reacting polyols (polyester or polyether) with isocyanates.
