According to our (Global Info Research) latest study, the global Low Frequency Geophone market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Low frequency geophone is a specialized seismic instrument used in geophysical surveys to detect and measure low-frequency seismic waves. It consists of a coil of wire surrounded by a magnetic core and a mass attached to a spring. When seismic waves pass through the ground, the mass of the geophone moves due to the vibrations. This movement generates a voltage in the coil, which is then converted into a measurable electrical signal. Low frequency geophones are designed to detect seismic waves in the frequency range of 1 Hz to a few tens of Hertz, allowing for the identification and analysis of low-frequency seismic events, such as earthquakes, ground vibrations, and geological processes. They are widely used in geophysical exploration, earthquake monitoring, and civil engineering applications.
