The global Low Frequency Geophone market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Low frequency geophone is a specialized seismic instrument used in geophysical surveys to detect and measure low-frequency seismic waves. It consists of a coil of wire surrounded by a magnetic core and a mass attached to a spring. When seismic waves pass through the ground, the mass of the geophone moves due to the vibrations. This movement generates a voltage in the coil, which is then converted into a measurable electrical signal. Low frequency geophones are designed to detect seismic waves in the frequency range of 1 Hz to a few tens of Hertz, allowing for the identification and analysis of low-frequency seismic events, such as earthquakes, ground vibrations, and geological processes. They are widely used in geophysical exploration, earthquake monitoring, and civil engineering applications.
