Abstracts

The global Low Frequency Heating System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A low frequency heating system is a specialized heating setup that utilizes low-frequency electromagnetic fields to generate heat in conducting materials. It takes advantage of the behavior of electrical currents induced in conductive objects when exposed to a varying magnetic field. By subjecting the material to a low-frequency magnetic field, the system induces electric currents, causing the material to heat up due to its electrical resistance. Low frequency heating systems find applications in industrial processes, such as metal heating and melting, as well as in medical therapies like deep heat therapy.

This report studies the global Low Frequency Heating System production, demand, key manufacturers, and key regions.
