Low-loss glass is a type of specialized optical glass engineered to minimize signal attenuation, scattering, and absorption when transmitting light, particularly in high-frequency or high-speed optical communication systems. It is characterized by its exceptionally high purity, low refractive index variation, and minimal inclusion of defects or impurities that can interfere with the propagation of light. Low-loss glass is critical in applications requiring precise and efficient light transmission, such as fiber optics, laser systems, photonic devices, and advanced imaging technologies. Its ability to preserve signal strength over long distances or through complex optical systems makes it essential for enhancing performance, reducing energy consumption, and maintaining signal fidelity in modern optical and telecommunications infrastructure.
