Abstracts

'Low Molecular Weight Heparin (LMWHs) is derived from UFH (Unfractionated heparin) by such processes as chemical degradation, enzymatic depolymerisation and gamma-radiation cleavage.

Natural heparin consists of molecular chains of varying lengths, or molecular weights. Chains of varying molecular weights, from 5000 to over 40,000 Daltons, make up polydisperse pharmaceutical-grade heparin. LMWHs, in contrast, consist of only short chains of polysaccharide. LMWHs are defined as heparin salts having an average molecular weight of less than 8000 Da and for which at least 60% of all chains have a molecular weight less than 8000 Da. '
