The global Low and Medium?Power Laser Cutting Control Systems market size is expected to reach \$ 506 million by 2032, rising at a market growth of 9.6% CAGR during the forecast period (2026-2032).

Low and Medium-Power Laser Cutting Control Systems are typically used for precision cutting of thin materials or small workpieces. These systems offer functions such as laser power adjustment, cutting speed control, and cutting path optimization, and are widely used in advertising production, electronic product assembly, and metal decoration. They have high requirements for precision and flexibility and are suitable for various small and medium-sized manufacturing industries. Board-based control systems are universal control systems that rely on boards and programmed control software to control the laser processing trajectory, external equipment, and processing technology. Follow-up control systems primarily control the height of the cutting head relative to the workpiece; the two are usually sold as a set. In 2025, the global production of Low and Medium-Power Laser Cutting Control Systems was approximately 140,900 units, with an average price of approximately US\$1,833.796 per unit and a gross profit margin of approximately 80.53%. Downstream customers include laser equipment manufacturers such as Han's Laser, HGLaser, YAWE, Leadcore Laser, Bystronic, JPT Laser, Lasertech, Qingyuan Laser, Hongshi Laser, Lens Technology, and JPT Optoelectronics.

With the accelerated transformation of the manufacturing industry towards automation, digitalization, and intelligence, the market for low-to-medium power laser cutting control systems has ushered in significant growth opportunities. These control systems are a core component for achieving automatic control of precision laser cutting, and their application scenarios cover many fields such as electronics manufacturing, light

industrial processing, and precision parts manufacturing. As a crucial branch of the advanced manufacturing equipment market, laser cutting machines are experiencing continuous global market expansion, driving increased demand for controllers. Simultaneously, the maturity of laser source technologies such as fiber lasers has lowered the barriers to entry for equipment use and improved the integration of control systems, further stimulating downstream demand. With the increasing demands for high-precision cutting in industries such as electric vehicles, aerospace, and consumer electronics, low-to-medium power laser cutting control systems are becoming a significant driving force for improving production efficiency and quality in the manufacturing sector. Despite the broad market prospects, manufacturers of low-to-medium power laser cutting control systems also face multiple challenges. First, the core technologies in this field have high barriers to entry, requiring controllers to possess high-precision real-time control capabilities and stable motion coordination performance, resulting in high R&D investment and technological accumulation thresholds. Second, with intensified industry competition, product homogenization is evident in the market, squeezing the profitability of some small and medium-sized enterprises under price competition. Furthermore, different application scenarios place higher demands on the integration and reliability of control systems, requiring companies to continuously optimize software compatibility, system stability, and after-sales service. Global supply chain fluctuations and rising raw material prices also put pressure on cost control for companies. From the perspective of downstream demand, the needs of different industries for control systems are showing a diversified trend. The precision manufacturing industry is increasingly demanding higher requirements for the real-time monitoring, dynamic path adjustment, and stability of control systems to meet the cutting needs of complex materials and high-precision structures. The electronics manufacturing and light industry sectors, on the other hand, focus more on cost efficiency and system usability. With the development of vision-guided and industrial robot collaborative control technologies, low- and medium-power laser cutting control systems are gradually evolving towards higher integration and greater intelligence, becoming a key node in the intelligent manufacturing ecosystem and driving industry R&D investment and product upgrades.
