A low-noise preamplifier is an amplifier specially designed to reduce noise interference. It is mainly used to amplify weak signals while minimizing the interference of its own noise on the signal, thereby improving the output signal-to-noise ratio. It is usually used in various applications that require high sensitivity and low noise. The low-noise preamplifier is the core device of precision signal processing. It is usually located at the front end of the signal chain and directly receives the original signal. Its performance directly affects the sensitivity and reliability of the detection system.
