According to our (Global Info Research) latest study, the global Low Pressure Plasma Spraying Equipment market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Low Pressure Plasma Spraying (LPPS) is a thermal spray process that uses a low-pressure plasma to heat and accelerate powder particles to create a coating on a substrate. The process involves introducing a gas into a vacuum chamber, where a low-pressure plasma is created by applying an electric field. Powder particles are then introduced into the plasma, where they are heated and accelerated towards the substrate. The particles impact the substrate and form a coating.

LPPS equipment typically consists of a vacuum chamber, a plasma generator, a powder feeder, and a substrate holder. The vacuum chamber is used to create a low-pressure environment, while the plasma generator is used to create the plasma. The powder feeder is used to introduce powder particles into the plasma, and the substrate holder is used to hold the substrate in place during the coating process.

LPPS is used to create coatings on a variety of substrates, including metals, ceramics, and polymers. The process can be used to create coatings with a wide range of properties, including wear resistance, corrosion resistance, and thermal insulation.
