## Abstracts

The global Low Shrinkage Polyester Film market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Low-shrink polyester film is a polyester film with a lower shrinkage rate. Shrinkage refers to the degree of dimensional change of a film during heating or stretching, usually expressed as a percentage. Low-shrink polyester film has a lower shrinkage rate than ordinary polyester film. Low shrinkage polyester film is usually achieved by changing the composition and structure of the polyester material or adding specific additives. These changes can reduce the thermal shrinkage or tensile shrinkage of the film during processing or use, thereby improving the dimensional stability of the film. Low shrinkage polyester film has the following characteristics and application advantages: 1. Good dimensional stability: Low shrinkage means that the film has small dimensional changes during heating or stretching and can maintain good dimensional stability. 2. Suitable for high-precision applications: Due to its good dimensional stability, low-shrink polyester film is suitable for applications that require high dimensional accuracy, such as insulating gaskets for electronic components, optical films, etc. 3. High transparency: Low shrinkage polyester film usually has high transparency and is suitable for applications where the transparency of the material needs to be maintained, such as packaging materials, printed matter, etc. 4. Good heat resistance: Low-shrink polyester film usually has good heat resistance and can maintain dimensional stability in high-temperature environments, making it suitable for applications in high-temperature processes or environments.
