Abstracts

The global Low Sparkling Antiglare (AG) Film market size is expected to reach \$ 182.3 million by 2029, rising at a market growth of 5.6% CAGR during the forecast period (2023-2029).

As technology continues to advance, the performance and quality of low flash point anti-glare films have been improved. The introduction of new materials, new formulas and new manufacturing processes has made anti-glare films more transparent and durable, and at the same time has a more significant suppression effect on reflection and glare. Low flash point anti-glare films usually also have the function of blocking ultraviolet rays and heat, which helps save energy and protect the environment. With the increasing awareness of environmental protection, people are paying more attention to energy efficiency and reducing carbon emissions, which has prompted the market to pay more attention to low flash point. With the intensification of market competition and technological advancement, the price of low flash point anti-glare film has gradually declined. This allows more consumers and businesses to afford and adopt this technology, further driving market development.

Low Sparkling Antiglare (AG) Film means that after special treatment on the glass/film surface, the glass/film surface becomes 'thick and hairy' and becomes a bumpy, matte, non-reflective surface. AG glass/film has a lower specular reflection ratio than ordinary glass/film, which can reduce the amount of specular reflected light entering the human eye. While reducing ambient light interference, it also improves the contrast and viewing angle of the screen. It also protects the eyes. The application of Low Sparkling Antiglare (AG) Film helps eliminate on-screen reflections, reduce eye fatigue, and provide better visibility. It can improve the viewing experience in bright environments, reduce users' interference with screen reflections, and make images and text more clearly visible.
