Abstracts

According to our (Global Info Research) latest study, the global Lubricants in the Oil and Gas market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A lubricant is a substance, usually organic, introduced to reduce friction between surfaces in mutual contact, which ultimately reduces the heat generated when the surfaces move. It may also have the function of transmitting forces, transporting foreign particles, or heating or cooling the surfaces. The property of reducing friction is known as lubricity.

Vibration, mechanical stress, contamination, and moisture are all threats to any machine in the oil & gas industry. All the moving parts in the equipment's need lubrication to function optimally. Lubricating oils (engine oil, gear oil, and hydraulic oils) offer solutions for drilling operations (for crude oil and natural gas extraction). They protect the equipment from an array of challenges like friction, high temperatures, adulteration from water, leaking oil, slurry and froth formation, and oxidation due to moisture. Excessive grease can cause additional issues and difficulties. These challenges result in maintenance downtime which is undesirable. The downtime is due to decreased engine life, lack of lubrication and replacement of parts. All of these leads to decrease in production. Use of proper lubricants allows the equipment's to run without maintenance downtime thus increasing its operational productivity.

The Global Info Research report includes an overview of the development of the Lubricants in the Oil and Gas industry chain, the market status of Onshore & Offshore Drilling (Diesel Engine Oils, Greases), FPSO (Diesel Engine Oils, Greases), and key
