According to our (Global Info Research) latest study, the global Low Temperature Data Logger market size was valued at US\$ 328 million in 2024 and is forecast to a readjusted size of USD 434 million by 2031 with a CAGR of 4.1% during review period.

A low temperature data logger is a device designed to record temperature data in low - temperature environments. A low temperature data logger typically uses a temperature - sensitive sensor, such as a thermocouple or a resistance temperature detector (RTD), to measure the ambient temperature. The sensor converts the temperature into an electrical signal, which is then processed and digitized by the logger's internal circuitry. The digitized data is stored in the logger's memory for later retrieval and analysis. Some data loggers may also have additional features, such as built - in algorithms to compensate for temperature - related errors and to ensure accurate measurements in low - temperature conditions.
