Abstracts

The global Low Temperature Edible Soybean Meal market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Low-temperature edible soybean meal is a kind of soybean meal with low protein denaturation and high water-soluble protein content after soybean oil extraction and desolvation treatment at low temperature or flash evaporation. It is a high-quality edible soybean protein source that can be used in food processing and feed production. The characteristics of low-temperature edible soybean meal are: high protein content, generally above 45%, high nitrogen solubility index (NSI), generally above 50%, indicating high protein digestion and absorption rate. The fat content is low, generally below 1.5%, which is beneficial to prevent oxidative deterioration and prolong the shelf life. Low anti-nutritional factors, such as urease, trypsin inhibitor, insulin-like growth factor binding protein, etc., are beneficial to improve nutritional value and biological activity. Light in color and fragrant in taste, it is suitable for food processing, such as soybean milk, soybean milk, tofu, etc.

This report studies the global Low Temperature Edible Soybean Meal production, demand, key manufacturers, and key regions.
