Abstracts

According to our (Global Info Research) latest study, the global Low-Temperature Organic Peroxide Initiator market size was valued at US\$ 409 million in 2025 and is forecast to a readjusted size of US\$ 534 million by 2032 with a CAGR of 3.9% during review period.

Low-temperature organic peroxide initiators refer to a class of organic peroxides that decompose to generate free radicals within a polymerization temperature range of approximately 40?70°C, or at relatively low half-life temperatures. Industrially, they are widely utilized to initiate the free-radical polymerization of olefinic monomers?such as in the production of polyvinyl chloride (PVC) and specialty resins?as well as for the low-temperature curing of unsaturated polyester resins.

Upstream raw materials primarily include alcohols, acyl chlorides or chloroformates, hydrogen peroxide, sodium hydroxide, and acid anhydrides. The raw material systems vary significantly across different product types; for instance, peroxydicarbonates are typically synthesized through reactions involving alcohols, chloroformates, and hydrogen peroxide, whereas peroxyneodecanoates are derived from neodecanoic acid derivatives and *tert*-butyl peroxide systems. Downstream applications involve their integration into polymerization systems for resins such as PVC, LDPE, EVA, vinylidene chloride, acrylates, and methacrylates.

In 2025, global sales volume is projected to reach approximately 53,000 tons, with an average global market price of approximately US\$7,500 per ton; the gross margins for major industry manufacturers are expected to range between 25% and 38%.
