According to our (Global Info Research) latest study, the global Low Temperature Solder Pastes market size was valued at USD 299.5 million in 2023 and is forecast to a readjusted size of USD 418 million by 2030 with a CAGR of 4.9% during review period.

Solder paste, a unique combination of minute metal solder particle and slimy flux, is exclusively known for its usage in the printed circuit board or PCB manufacturing. This special paste attaches the mount particles to pads on the board and creates a stable bond between two different work elements. In this process, the sizes of the metal particles and the density of the flux play a significant role and decide the outcome of the solder paste.

Low-temperature solder paste, is a very extraordinary blend of tiny metal particles and sticky flux. This easily dissolves even at a temperature under 180° C. Usually, the typical solder paste temperature extends over 250° C to 240° C, which often becomes destructive for some delicate particles.

A solder paste having a melting point of 138 ° C is called a low-temperature solder paste.
