## Abstracts

According to our (Global Info Research) latest study, the global Low Vision Magnifier market size was valued at US\$ 324 million in 2025 and is forecast to a readjusted size of US\$ 439 million by 2032 with a CAGR of 4.0% during review period.

In 2025, global Low Vision Magnifier production reached approximately 9,000 k units with an average global market price of around US\$ 35 per unit, and a gross profit margin of approximately 10%-30%. A low vision magnifier is an assistive device designed to help people with reduced visual acuity, contrast sensitivity, or central/peripheral vision loss perform everyday tasks by enlarging text and images and improving visibility. Unlike ordinary reading aids, low vision magnifiers are engineered for users whose eyesight cannot be fully corrected with standard glasses or contact lenses and may combine magnification with lighting, contrast enhancement, and glare control to match specific visual conditions. The category includes traditional optical magnifiers (handheld, stand, or illuminated lamps with lenses) as well as electronic video magnifiers often called CCTV magnifiers that use a camera to capture print or objects and display them on a built-in screen or external monitor with adjustable zoom, focus, and color/contrast modes (for example, reverse polarity or false-color options). Many electronic models add features such as image freeze, reading lines and masks, distance viewing, and increasingly OCR with text-to-speech to support users who struggle with sustained reading. Devices are selected based on the user's task needs (reading labels, books, writing, hobbies, or viewing signs), required magnification and field of view, portability, and ease of operation, with large tactile controls and simple menus favored in clinical and senior settings.

The Low Vision Magnifier market spans both optical magnifiers

(handheld/stand/illuminated) and electronic video magnifiers (portable and desktop CCTV systems), serving users whose vision loss cannot be fully corrected with standard eyewear. Demand is fundamentally supported by the large and growing population living with vision impairment worldwide, alongside broader demographic ageing and the wider need for assistive technologies. Market competition is shaped less by basic magnification and more by task-specific usability (reading vs writing vs hobbies vs distance viewing), contrast and lighting control, and increasingly reading assistance features such as OCR and text-to-speech (common in modern desktop video magnifiers) and rich contrast mode/reading-guidance functions in portable devices.
