Abstracts

According to our (Global Info Research) latest study, the global Low Voltage Fuse Disconnect Switch market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The low-voltage fuse-type isolating switch is widely used in the low-voltage side outlet of the bench-type transformer due to its advantages of low cost, stable operation and convenient maintenance. Existing low-voltage fuse-type isolating switches generally include a mounting base, a static contact and a moving contact installed on the mounting base, and a fuse piece. A blade is hinged on the moving contact, and the other end of the blade is connected to the switch. When closed, it is in contact with the static contact; the static contact and the moving contact are respectively installed on the insulating column. In the power system, the low-voltage fuse-type isolation switch controls the on-off of the current and plays an important role. When the fuse is blown, electric personnel need to remove the moving contact in time to replace the fuse, and then install it. Since disassembly and installation are generally operated by a pull rod, the disassembly structure not only requires a tight combination with the moving contact seat and the static contact, but also requires the disassembly structure to be convenient for the operation of the pull rod. However, the disassembly structure of the existing isolating switch cannot well meet the above requirements. In addition, the existing low-voltage fuse-type isolating switch in operation often has certain potential safety hazards because the switch is not closed tightly when the switch is closed, and has the problems of short service life and high maintenance costs.
