Abstracts

A low-voltage, high-resistance grounding system generally refers to a grounding system designed for use with electronic equipment or circuit boards. This type of system is designed to provide a low-resistance path to ground that effectively directs interference or spurious signals in the circuit to ground. Compared with traditional ground wires, low-voltage high-resistance grounding systems focus more on reducing current circulation on the ground loop, thereby reducing common-mode interference or ground loop noise caused by ground loops. This helps improve the performance, stability and anti-interference capabilities of the circuit, especially in applications that require higher signal quality, such as high-speed communications, precision instruments or high-frequency circuits.

According to our (Global Info Research) latest study, the global Low Voltage High Resistance Grounding System market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
