According to our (Global Info Research) latest study, the global LowDK Glass Fabric market size was valued at US\$ 290 million in 2024 and is forecast to a readjusted size of USD 562 million by 2031 with a CAGR of 9.9% during review period.

LowDK glass fabric refers to a type of woven fabric made from glass fibers that is designed to have a low dielectric constant (DK), meaning it has reduced electrical insulation properties compared to standard glass fabrics. This makes it particularly useful in applications where signal integrity and high-frequency performance are important, such as in printed circuit boards (PCBs), electronics, and communication devices. The low dielectric constant reduces signal loss, improves performance at high frequencies, and ensures better reliability in high-speed electronic circuits. LowDK glass fabrics are often used in advanced applications in industries like telecommunications, aerospace, and automotive, where performance and minimal electrical interference are critical.
