According to our (Global Info Research) latest study, the global Lower Extremity Powered ExoSkeleton market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Lower extremity exoskeletons developed for human locomotion assistance are used to help patients who have completely lost mobility in the lower limbs due to conditions such as SCI, multiple sclerosis, etc. These systems offer external torque at the location of human joints to replace the patients' impaired motor function, enabling them to perform daily movements such as standing up, sitting down and walking. They can function as assistive and rehabilitative devices. Most of these exoskeletons require the patients to balance themselves and therefore a healthy upper body is required. Compared to stationary systems, powered robotic exoskeletons are compact, lightweight and portable and can therefore be potentially used at home.
