## Abstracts

According to our (Global Info Research) latest study, the global Lufenuron market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Lufenuron is an insect growth regulator that controls flea infestations in dogs, cats, rabbits, and ferrets. It is frequently found in combination with other medications such as milbemyacin and/or praziquantel. Lufenuron works as a growth inhibitor. Therefore, the adult flea must feed on a treated animal to ingest the drug, and any eggs produced by this adult will not survive. It does NOT kill adult fleas nor does it repel fleas. Because the effects are targeting offspring, the overall flea control effects can take several months. Therefore, this medication works better in combination with other products for long-term control as opposed to a sole therapy.
