Abstracts

The global Lutetium Resources market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Lutetium is a chemical element with the symbol Lu and atomic number 71. It is a rare earth metal that is typically found in small amounts in minerals such as monazite and xenotime. Lutetium is the last element in the lanthanide series, and as such, it is the rarest and most expensive of all the rare earth metals.

Lutetium has several important uses in industry and research. It is used as a catalyst in various chemical reactions, as well as in the production of specialty glasses and ceramics. Lutetium-176 is also used as a radioactive tracer in medical imaging studies, particularly for bone scans and prostate cancer imaging.

In recent years, there has been increasing interest in the potential use of lutetium as a material for nuclear reactor control rods. Lutetium-based control rods have the potential to improve the safety and efficiency of nuclear reactors, and several countries, including China and the United States, have been investing in research and development in this area.

Due to its rarity and importance in various industries, lutetium resources are considered to be a valuable commodity. However, it is worth noting that the global reserves of lutetium are relatively small, and as such, efforts are underway to develop more efficient methods for extracting and recycling lutetium to meet growing demand.

This report studies the global Lutetium Resources production, demand, key manufacturers, and key regions.
