## Abstracts

According to our (Global Info Research) latest study, the global Machine Vision Logistic market size was valued at USD 3357.5 million in 2022 and is forecast to a readjusted size of USD 5557.4 million by 2029 with a CAGR of 7.5% during review period.

Machine vision (MV) systems use one or more video cameras, digital signal processing, and analog-to-digital conversion to allow a computer to observe, inspect and scrutinize task performance. The data is subsequently sent to a computer, which analyses it and generates the desired output. Any machine vision system must have both high resolution and sensitivity. Resolution is responsible for distinguishing between things, whereas sensitivity refers to the machine's ability to detect objects or weak signals in dim light or at wavelengths invisible to the naked eye. In implementing computer vision solutions in their facilities, logistics providers can avoid wasting time searching for misplaced assets and manually confirming asset locations. They can also use the analyses from visual AI to further optimize operations and accurately determine inventory stock levels.
