According to our (Global Info Research) latest study, the global Magnesium Amino Acid Chelate market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Magnesium amino acid chelate is a form of magnesium supplement that combines magnesium with amino acids, which are the building blocks of proteins. In this chelated form, magnesium is bonded to amino acids, such as glycine or lysine, to enhance its absorption and bioavailability in the body.

The chelation process involves binding the magnesium ions to the amino acids. This bond helps to protect the magnesium from being readily absorbed in the stomach, where it can interact with other compounds and potentially cause gastrointestinal discomfort. By forming a chelate, the magnesium is more effectively absorbed in the intestines and transported into the bloodstream for use by the body.
