Abstracts

According to our (Global Info Research) latest study, the global Magnesium Chloride Compounds market size was valued at US\$ 265 million in 2025 and is forecast to a readjusted size of US\$ 328 million by 2032 with a CAGR of 3.3% during review period.

Magnesium chloride is an inorganic compound with the formula $MgCl_2$. It forms hydrates $MgCl_2 \cdot nH_2O$, where n can range from 1 to 12. These salts are colorless or white solids that are highly soluble in water. These compounds and their solutions, both of which occur in nature, have a variety of practical uses. In 2025, global Magnesium Chloride Compounds production reached approximately 2829 K MT.

Demand from construction and infrastructure is a major driver for the global magnesium chloride market. $MgCl_2$ is widely used for dust suppression on unpaved roads and construction sites, and as a de-icing and anti-icing agent where it can offer performance advantages over some traditional salts in certain temperature and application conditions. Ongoing urbanization, road building, and maintenance spending increase consumption, while municipalities and contractors look for products that improve road safety, reduce downtime, and manage particulate emissions.

Industrial and process applications also push growth, especially where $MgCl_2$ is a cost-effective and reliable input. It is used in wastewater and effluent treatment for certain treatment chemistries, in the production of magnesium compounds and magnesium metal, and in various chemical processing steps where chloride salts are required. As industries expand capacity and tighten process control, buyers often favor consistent quality, predictable supply, and forms that reduce handling costs, such as flakes, pellets, or concentrated brines.

Food, pharmaceutical, and agriculture-related uses add another layer of demand, particularly in higher-purity grades. MgCl₂ is used as a coagulant in tofu production, as a mineral source in nutraceutical and medical formulations, and as a magnesium input for specific fertilizer blends and soil amendment programs where magnesium deficiency affects yields. Rising consumer focus on nutrition, growth in plant-based food production, and efforts to improve soil health and productivity can all support steady demand, while supply reliability and pricing of natural brines and by-product sources influence purchasing decisions across regions.
