Abstracts

The global Magnesium Monoperoxyphthalate market size is expected to reach \$ 276 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Magnesium Monoperoxyphthalate (MMPP) is an organic peroxygen compound (a magnesium salt of monoperoxyphthalic acid) widely used as a mild, stable oxidizing agent in organic synthesis, fine chemicals, pharmaceuticals, and specialty cleaning formulations; it provides selective oxidation (e.g., epoxidation, Baeyer-Villiger oxidation) with safer handling compared to traditional peracids. The supply chain starts upstream with petrochemical-derived phthalic anhydride (from o-xylene or naphthalene oxidation), which is converted into phthalic acid derivatives and then reacted with hydrogen peroxide (from the anthraquinone process) to form monoperoxyphthalic acid, followed by neutralization with magnesium salts (e.g., magnesium oxide or hydroxide) to produce MMPP; midstream production involves controlled peroxidation, crystallization, stabilization (to improve shelf life and safety), and formulation into powders or granules; downstream, it is distributed through specialty chemical suppliers to end users in pharmaceuticals, agrochemicals, polymer modification, and laboratory reagents, with strict logistics controls due to its oxidizing nature and sensitivity to heat, contamination, and moisture. In 2025, global Magnesium Monoperoxyphthalate output was about 400 tons with 800 tons of capacity, average prices of USD 400,000-800,000 per ton, and gross margins around 31%.
