Abstracts

The global Magnesium Naphthenate market size is expected to reach \$ 15.05 million by 2032, rising at a market growth of 2.9% CAGR during the forecast period (2026-2032).

Magnesium naphthenate is an important organometallic compound, a salt formed from naphthenic acid and magnesium. It combines the lipophilic properties of naphthenic acid with the characteristics of magnesium ions, exhibiting good fluidity, stability, and high-temperature cleaning capabilities. It is insoluble in water but soluble in organic solvents. The upstream core raw materials are naphthenic acid (extracted from acidic water or distillate oil from crude oil refining) and magnesium salts (such as magnesium oxide, magnesium hydroxide, or magnesium sulfate). The quality of naphthenic acid directly determines the oil solubility and stability of the product. In 2025, global sales are projected to be approximately 3189 tons, with an average market price of approximately US\$3700 per ton. The industry's gross profit margin is in the range of 10%?25%.

Magnesium naphthenate is an important organomagnesium compound, possessing both the lipophilicity of naphthenic acid and the properties of magnesium. It is primarily used in applications such as lubricating oil additives and paint driers. Regulatory and environmental pressures are reshaping the selection of metals used in driers, and even though magnesium naphthenate is not a mainstream primary drying metal, it may benefit as part of a synergistic formulation. Improvements in upstream naphthenic acid extraction technologies (such as the optimization of deacidification processes for high-acid crude oil) provide more stable raw materials with higher acid values ??for downstream production.
