## Abstracts

According to our (Global Info Research) latest study, the global Magnetic Coagulation and Sedimentation System market size was valued at US\$ 87 million in 2024 and is forecast to a readjusted size of USD 107 million by 2031 with a CAGR of 3.1% during review period.

Magnetic Coagulation and Sedimentation System is a specialized water treatment technology that integrates magnetic coagulation with sedimentation processes to enhance the removal of fine particles and contaminants from water. In this system, coagulants are first added to destabilize and aggregate suspended solids, forming flocs. Magnetic particles are then introduced, which bind to the flocs, increasing their density and responsiveness to magnetic fields. These magnetized flocs are more easily separated from the water through sedimentation, significantly accelerating settling rates and improving overall treatment efficiency. This system is widely used in industrial wastewater treatment, municipal water purification, and other applications where rapid and efficient solid-liquid separation is required.
