Magnetic Flux Leakage (MFL) Nondestructive Test System is a technique used to detect flaws, cracks, or corrosion in ferromagnetic materials, such as pipelines, storage tanks, and other metal structures. It works by magnetizing the material and analyzing the magnetic field for disruptions caused by defects. When there is a flaw, the magnetic flux 'leaks' out of the material, which is detected by sensors and converted into a visual or digital signal for analysis. MFL is widely used for its ability to provide rapid, accurate, and reliable assessments of structural integrity without causing damage to the material being inspected.
