## Abstracts

The global Magnetic Incremental Linear Encoder market size is expected to reach \$ 618 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

In 2025, global magnetic incremental linear sensor production reached approximately 915 k units, the average price is 400 usd/unit. Magnetic incremental linear sensor is a kind of device which can accurately measure the linear displacement of object by detecting the change of magnetic field. It converts the position movement into electrical signal output and is widely used in the field of precise positioning and motion control.

### Market Concentration and Key Players:

Internationally, the market concentration of magnetic incremental linear sensors is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, Eltra Encoder and Balluff and other large manufacturers; from the domestic point of view, magnetic incremental linear sensors still have a lot of room for development.

### Manufacturing Processes and Market Trends:

The core of the manufacturing process of magnetic incremental linear sensors lies in the integration of magnetic sensors with precision magnetic grid rulers. Its core magnetic sensor chips are usually manufactured on silicon substrates using semiconductor processes, and use thin film deposition and lithography technology to form micron-level sensing structures.. For high performance requirements, the manufacturing process integrates temperature compensation algorithms and multi-stage

signal conditioning circuits to cope with temperature drift and improve interference immunity. The key links include precisely aligning the magnetic sensor chip with the permanent magnet, and ensuring the uniformity of the magnetic pole period of the magnetic grid ruler to achieve stable sine/cosine signal output. In addition, the sensor will adopt a fully sealed structure to resist the impact of harsh industrial environments such as dust and oil.

In terms of market trends, the global demand for magnetic incremental linear sensors is growing steadily, mainly driven by industrial automation, the popularity of robotics and the rapid development of the new energy automobile industry. The product technology itself is evolving towards higher precision, greater intelligence and smaller size to meet the needs of smart equipment and portable devices. Future competition will focus more on product reliability, stability in complex electromagnetic environments, and cost control capabilities, and technological developments will be more deeply integrated with new materials (such as rare-earth permanent magnets with higher coercivity) and artificial intelligence algorithms.
