## Abstracts

According to our (Global Info Research) latest study, the global Magnetic Lens market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A magnetic lens is a device that can use a magnetic field to focus or diverge a charged particle beam (such as an electron beam). The function of this device is similar to the focusing or diverging effect of an optical lens on a beam, but the object of operation is a charged particle beam. The magnetic lens achieves its function by generating an axisymmetric magnetic field. This magnetic field can be generated by a solenoid, an electromagnet or a permanent magnet. When a charged particle beam (such as an electron beam) enters this magnetic field, it is deflected by the Lorentz force, thereby achieving a focusing or diverging effect.

Magnetic lenses are widely used in many fields, including electron microscopes, cathode ray tubes, vacuum devices, particle accelerators, etc. In these applications, magnetic lenses are used to focus electron beams or other charged particle beams for imaging, analysis, and experiments.
