According to our (Global Info Research) latest study, the global Magnetostrictive Linear Position Transducers market size was valued at US\$ 186 million in 2024 and is forecast to a readjusted size of USD 289 million by 2031 with a CAGR of 6.5% during review period.

The magnetostrictive linear position transducer is based on the Weidmann effect between the magnetostrictive waveguide wire and the vernier magnetic ring, which is the core detection element of the transducer, and accurately detects the absolute position of the movable magnetic ring through the internal non-contact measurement and control technology to measure the actual displacement value of the detected product . Since there is no direct contact between the active magnetic ring and the sensitive element, which determine the position, the transducer can be used in extremely harsh industrial environments and is not easily affected by oil stains, solutions, dust or other contamination. In addition, the sensor uses high-tech materials and advanced electronic processing technology, so it can be used in high temperature, high pressure and high vibration environment.
