According to our (Global Info Research) latest study, the global Main Positive Relay market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The main positive relay is an electronic control device that adopts a dual-coil design. One coil is the main coil, which is directly connected to the power supply; the other is the positive coil, which is connected to the control power supply. When the positive coil is energized, it will trigger the main coil to be energized at the same time, thereby generating a strong magnetic field, causing the relay contacts to be attracted or disengaged, thereby closing or disconnecting the circuit. The biggest feature of the main positive relay is its dual-coil design, which enables the relay to have unidirectional control capabilities, that is, the main coil can only be energized by controlling the positive coil through the control power supply. Due to the dual-coil structure, the main positive relay has stronger control capabilities in circuit control and can realize complex circuit logic. The main positive relay is usually designed to carry larger currents, so it is widely used in occasions where large current circuits need to be controlled. Due to its special design and working principle, the main positive relay performs well in response speed, and can quickly respond to control signals and complete the switching of circuit states.
