## Abstracts

The working principle of the hemodialysis catheter is that after the catheter is inserted into the central venous system, it is connected to the hemodialysis pipeline and the dialysis machine. The blood containing metabolic wastes from the dialysis patient is inhaled from the arterial end of the catheter, passes through the circulation pipeline and the dialysis machine, and passes through diffusion and convection. And physical mechanisms such as adsorption, remove excess water and toxins in the body, adjust the patient's electrolyte and acid-base balance, and the purified blood is pumped back to the central vein of the human body at the venous end of the catheter.
