Polypropylene (PP) is a universal polymer material with excellent performance and wide application. The mechanical properties of PP can be further improved by blending and compounding, and its application field can be widened. The key of PP modification is to increase its polarity and improve the compatibility of PP with packing or other polar polymers. With polar maleic acid (MAH) graft PP(PP-G-MAH), in the macromolecular chain to introduce appropriate polarity of the branch chain, improve the performance of PP, but also can increase the new properties, is to improve the performance of PP, expand its application range of a simple and effective method.
