According to our (Global Info Research) latest study, the global Mammalian Cell Expression System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Mammalian cell expression system is a type of recombinant protein expression system that uses genetically modified mammalian cells to produce large amounts of specific proteins. Mammalian cells are a popular choice for protein expression because they have the ability to perform post-translational modifications such as glycosylation, phosphorylation, and disulfide bond formation, which are important for the biological activity and stability of many proteins. Mammalian cell expression systems are widely used in the production of recombinant proteins for research, therapeutic, and industrial applications. They offer high protein expression levels, produce proteins with correct post-translational modifications, and are suitable for the production of complex and difficult-to-express proteins.
