## Abstracts

According to our (Global Info Research) latest study, the global Mammography X-Ray Unit market size was valued at USD 2001.3 million in 2023 and is forecast to a readjusted size of USD 3680 million by 2030 with a CAGR of 9.1% during review period.

Mammography X-ray Unit is the equipment using low-energy X-rays (usually around 30 kVp) to examine the human breast, and it is used as a diagnostic and screening tool. Mammography X-ray Unit is for the early detection of breast cancer, typically through characteristic masses' detection.

Like all X-rays equipment, Mammography X-ray Unit use ionizing radiation to create images. These images are then analyzed for any abnormal findings. It is normal to use lower-energy X-rays (typically Mo-K) than those used for radiography of bones. Ultrasound, ductography, positron emission mammography (PEM), and magnetic resonance imaging (MRI) are adjuncts to mammography. Ultrasound is typically used for further evaluation of masses found on mammography or palpable masses not seen on mammograms. Ductograms are still used in some institutions for evaluation of bloody nipple discharge when the mammogram is non-diagnostic. MRI can be useful for further evaluation of questionable findings as well as for screening pre-surgical evaluation in patients with known breast cancer to detect any additional lesions that might change the surgical approach.

Global Mammography X-Ray Unit key players include Hologic, GE Healthcare, Siemens, FUJIFILM, Philips Healthcare, etc. Global top five manufacturers hold a share over 80%.

North America is the largest market, with a share over 35%, followed by Europe and China, both have a share over 35%.
