According to our latest research, the global Manned Aerial Survey Service market size will reach USD 17610 million in 2031, growing at a CAGR of 3.3% over the analysis period.

Manned Aerial Survey Service is a method of collecting geomatics or other imagery by using airplanes, helicopters, or other manned aerial methods. Typical types of data collected include aerial photography, Lidar, remote sensing (using various visible and invisible bands of the electromagnetic spectrum, such as infrared, gamma, or ultraviolet) and also geophysical data (such as aeromagnetic surveys and gravity. It can also refer to the chart or map made by analysing a region from the air. Today, aerial survey is sometimes recognized as a synonym for aerophotogrammetry, part of photogrammetry where the camera is placed in the air. Measurements on aerial images are provided by photogrammetric technologies and methods.

Manned aerial surveys can carry large payloads and precise survey equipment that cannot be mounted on UAVs. As a result, manned aircraft can capture massive volumes of data, accurately and efficiently. The hardware and software can cope with large-scale projects and satisfy the needs of substantial datasets such as large mine sites, densely vegetated terrain, populous areas and areas covering hundreds of square kilometres.
