Abstracts

The global Manual Flexion Table market size is expected to reach \$ 62.62 million by 2032, rising at a market growth of 2.3% CAGR during the forecast period (2026-2032).

A manual flexion table is a specialized chiropractic treatment table that allows practitioners to perform spinal adjustments with controlled flexion, extension, and lateral movements, often using a removable handle for precise manual control, enabling techniques like figure-8 range of motion and deep flexion for treating spinal issues like disc problems and subluxations. These tables often feature movable sections, drop mechanisms (cervical, pelvic, thoracic), and sometimes electric elevation, offering versatility for various adjustment styles.

Global production of manual flexion tables is projected to reach 5,800 units by 2025, with an average price of \$8,900 per unit. Gross profit margins typically range from 30% to 45%.

Manual flexion tables are mainly used for spinal traction, flexion decompression, and conservative rehabilitation therapy, and are commonly applied in spinal rehabilitation, chiropractic care, and pain management. The upstream segment consists primarily of metal profiles, steel structural parts, mechanical transmission components, hydraulic or spring mechanisms, surface coating materials, foam, and synthetic leather, with core considerations centered on structural strength, durability, and stable long-term supply. The downstream segment represents the core of demand. Hospital rehabilitation and pain management departments are the main users, focusing on clinical safety, treatment stability, and compatibility with existing rehabilitation workflows, with durability and after-sales service being key purchasing factors. Chiropractic clinics and physical therapy centers are a fast-growing downstream group, emphasizing operational

flexibility, patient comfort, and treatment efficiency. Sports rehabilitation institutions and elderly care and rehabilitation centers see demand closely linked to the expanding population with chronic low back pain and degenerative spinal conditions. Small clinics and primary healthcare facilities are more price sensitive and tend to prefer standardized, structurally simple models. Overall downstream demand is closely tied to population aging, the prevalence of chronic spinal disorders, and the growing acceptance of non-surgical treatment approaches.

In terms of trends, manual flexion tables are mainly evolving through structural optimization and ergonomic improvements, with gradual movement toward modular design, lighter weight, and enhanced safety, while electrification and intelligence remain limited. Key drivers include the increasing number of patients with chronic lumbar and cervical spine conditions, rising demand for rehabilitation and conservative therapies, and the expansion of primary rehabilitation services and private medical institutions. Major constraints include variability in individual treatment outcomes, limited standardization of clinical evidence, insufficient reimbursement coverage in some regions, and competition from electric or intelligent therapy equipment.
