According to our (Global Info Research) latest study, the global Manual Plasma Cutting Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A manual plasma cutting machine is a tool used for cutting various types of metal and other conductive materials. It uses a high-velocity jet of ionized gas, typically compressed air, to melt and remove metal from a workpiece. The basic components of a manual plasma cutting machine include:

Power source: The power source generates the electrical current needed for the plasma cutting process. It typically operates on either single-phase or three-phase electricity.

Plasma torch: The plasma torch is the handheld or machine-mounted device that delivers the ionized gas (plasma) to the workpiece. It also includes a nozzle that focuses and controls the plasma arc.

Gas supply: Plasma cutting requires a specific type of gas, often compressed air, oxygen, or a mix of gases, to create the plasma. The choice of gas depends on the material being cut.

Control system: A control system, either manual or CNC (Computer Numerical Control), allows the operator to adjust cutting parameters such as amperage, gas flow, and cutting speed. CNC systems are more precise and can follow programmed patterns for intricate cuts.

Manual plasma cutting machines are commonly used for tasks like cutting metal sheets, pipes, and plates. They offer a relatively portable and affordable solution for cutting through a wide range of materials, making them popular in metal fabrication, automotive repair, construction, and other industries. However, manual operation may require more skill and precision from the operator compared to automated CNC plasma cutting systems.
