Manufacturing Internet of Things refers to connected systems that link industrial equipment, sensors, controllers, software platforms, and data networks to collect, transmit, analyze, and act on production information in real time. It supports equipment monitoring, predictive maintenance, energy management, quality control, traceability, production scheduling, and digital factory operation. Compared with isolated automation systems, manufacturing IoT emphasizes device interconnection, data visibility, remote management, and cross-system optimization. It is widely used in discrete manufacturing, process industries, electronics, automotive, machinery, food processing, pharmaceuticals, and smart factory projects.

The industrial chain of Manufacturing Internet of Things covers upstream sensors, industrial gateways, PLCs, RFID devices, communication modules, edge computers, servers, cloud resources, cybersecurity tools, and industrial software foundations. The midstream includes system architecture design, device networking, data acquisition, platform development, analytics, visualization, integration, testing, and deployment. Downstream applications mainly include smart factories, automotive production, electronics manufacturing, machinery processing, chemical plants, food factories, pharmaceutical production, warehousing, and energy management. Related services

include consulting, implementation, customization, data modeling, system maintenance, cybersecurity protection, software upgrades, and continuous optimization of production efficiency and equipment utilization.

Digital transformation and smart factory construction accelerate the popularization of the Manufacturing Internet of Things. It realizes interconnection of production equipment, real-time data collection and intelligent scheduling, helping enterprises reduce costs and raise production efficiency. Edge computing and industrial algorithm empowerment continuously expand scenario-based application value.
