Abstracts

The global Marble market size is expected to reach \$ 78010 million by 2032, rising at a market growth of 2.1% CAGR during the forecast period (2026-2032).

Marble is a metamorphic rock that forms when limestone undergoes heat and pressure during the process of metamorphism. It is primarily composed of the mineral calcite (CaCO₃), but may also contain other minerals such as clay, micas, quartz, pyrite, iron oxides, and graphite. Under metamorphic conditions, the calcite in limestone recrystallizes to create interlocking crystals, giving marble its characteristic appearance. Marble is known for its beauty, strength, and variety of colors and patterns, making it a popular choice in architecture and art. It is commonly used for decorative purposes, including flooring, countertops, sculptures, and monuments.
