## Abstracts

The global Margarine Kneading Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Margarine kneader, when the semi-finished oil product containing crystal nuclei enters the kneader, the crystals will grow over a period of time. If the semi-finished oil products are allowed to crystallize in a static state, a network structure of solid fat crystals will be formed. The overall hardness is very high and there is no plasticity. To obtain a product with a certain degree of plasticity, mechanical kneading must be performed before forming an overall network structure to break the originally formed network structure and make it recrystallize, reduce the consistency, and increase plasticity. The kneader fully stirs and kneads the semi-finished oil product (speed adjustable 50--300 rpm/min), and slowly forms crystals. Due to the crystallization heat (about 50kcal/kg) generated by crystallization and the friction heat generated by stirring, the temperature of the material leaving the kneader has risen, making the crystallized material soft.
