## Abstracts

The global Marine Autopilot Controller market size is expected to reach \$ 305 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

The marine autopilot controller is the core control unit of a ship's automatic steering system. Its primary function is to provide continuous and stable control commands to the steering gear, hydraulic actuators, or electric steering motors under specified heading or track conditions. This significantly reduces the workload on the crew during cruising, long-distance voyages, rough seas, or multi-tasking navigation scenarios. This device typically forms a closed-loop control system with heading sensors (magnetic compass/gyrocompass), GNSS, wind speed and direction sensors, speedometers, and the steering gear system, making it a typical 'decision and execution center' in the ship's control system. From an engineering perspective, the autopilot controller is not an isolated device but an important submodule of the ship's navigation control system. The stability of its control algorithms, redundant design, and long-term reliability directly affect the ship's heading accuracy and navigation safety. In 2025, the global market for new marine autopilot controllers is projected to reach approximately 127,000 units, with leisure boats and small to medium-sized yachts accounting for the largest share in terms of volume, but large yachts, engineering vessels, and high-end commercial vessels contributing more in terms of value. The price of a single autopilot controller is typically around US\$1,540; however, if it is part of a complete system including steering gear, hydraulic pump, and sensors, the delivery price can increase to US\$3,000 per set. In terms of typical equipment usage, a 30-45 foot yacht usually has one autopilot controller; large service vessels and engineering vessels often have two or more to meet redundancy and multiple bridge requirements.
