Abstracts

According to our (Global Info Research) latest study, the global Marine Cathodic Protection (CP) Systems market size was valued at US\$ 5747 million in 2025 and is forecast to a readjusted size of US\$ 8384 million by 2032 with a CAGR of 5.5% during review period.

In 2025, the global production of marine cathodic protection (CP) systems reached approximately 111,700 units, with an average global market price of around US\$50,000 per unit. In the same year, the global total production capacity of marine cathodic protection (CP) systems reached 140,000 units. The industry average gross profit margin of this product reached 37%.

A marine cathodic protection system is a technical system that uses electrochemical principles to prevent corrosion of ship hulls and marine structures. Its core principle is to use sacrificial anodes or impressed current methods to make the protected metal structure the cathode in the electrochemical reaction, thereby inhibiting the metal oxidation and corrosion reaction. This system typically consists of anode materials, a reference electrode, a DC power supply, a control cabinet, and a monitoring system. It is widely used in merchant ships, warships, offshore platforms, and port facilities, and is one of the key technologies for the life management and structural integrity assurance of marine engineering assets.

The marine cathodic protection system industry chain can be divided into three main segments: upstream materials and core components, midstream system integration and engineering services, and downstream application markets. The upstream mainly includes suppliers of non-ferrous metal materials, rare earth oxide coating materials,

power electronic components, cables, and testing equipment. The midstream comprises cathodic protection system design and integration companies, responsible for ICCP/SACP system design, ship adaptation solutions, installation and commissioning, and offshore construction services, as well as corrosion engineering companies and ship repair companies. Downstream applications cover commercial ships, naval vessels, offshore oil platforms, LNG carriers, port steel structures, subsea pipelines, and offshore wind power infrastructure. The overall industry exhibits a typical structure integrating heavy assets and high-tech services, characterized by 'materials-driven + engineering integration + long-cycle operation and maintenance services.'

The future growth of the global marine cathodic protection industry will be driven by three major trends: First, the continued expansion of global shipping and the aging of the fleet will drive the demand for ship corrosion prevention and life extension retrofits; second, the rapid development of marine energy will significantly increase the penetration rate of cathodic protection systems for marine engineering structures; and third, the International Maritime Organization (IMO) and classification societies are continuously tightening regulations on hull corrosion control and safety, promoting the upgrading of intelligent and digital monitoring systems for ICCP. In the future, the industry will evolve from traditional 'passive corrosion protection materials' to 'intelligent corrosion management systems,' and integrate with IoT monitoring and digital twin hull management systems to form a long-term and stable maintenance and service revenue model.
